

Application of SSRS for Automating Regular Reports

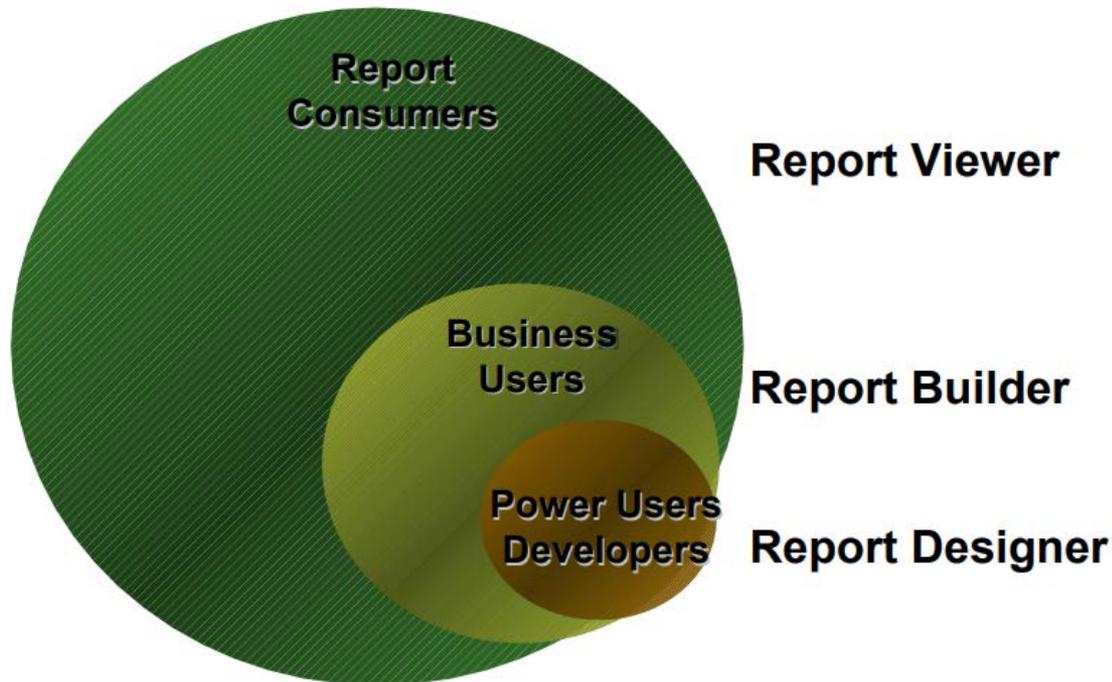

Fikrewold H. Bitew, PhD
Ashwin Jayagopal

What is SSRS?

- SSRS is really nothing more than a website that hosts web-based reports.
 - It can be made public, or kept internal to your intranet.
- If you want to show basic tabular reports and graph reports in a web browser

➤ **This is your tool of choice.**

Why Report Builder?

- One of the primary **reasons** that organizations implement Reporting Services is to provide **managed reports** to a large number of internal users

SSRS Report Types:

- **Managed Report:**
 - detailed operational data.
 - gathered from a variety of data sources.
 - organized into a central repository.
 - Standard formatting.
- **Ad hoc Report:**
 - Report builder
 - Users with limited technical skills.
 - Simple reports saved privately or shared.
- **Embedded Report:**
 - portals or custom applications.

Report Access

- The most common way to use a browser and navigate to a central report repository.
- Portal application with links to guide users to reports in Reporting Services.
- Store a selection of reports in a personal folder.
- Subscription to a report to receive it on a scheduled basis in an e-mail inbox, a network file share, or a SharePoint document library.
- A report rendered in HTML, PDF, TIFF, CSV or XML.

Advantages:

- Automation of regular reports requested by users
- Easily create : Tables, Charts, Crosstabs
- Integrate the reporting with SQL
- Easily create Parameters - b/c parameters can be created easily using SQL.
- Unlike other reporting tools which have their own custom based language.
- Create a long paginated report
- Easily exportable to any format: Eg. Excel , PDF and MS Word

Types of Reports

“Let your DATA tell us your story”.

Example

- https://utsacloud.sharepoint.com/sites/vpie/vpaieOIR/subSite_biCenter/SitePages/Home.aspx
- http://bireporting/PBIRS/Pages/ReportViewer.aspx?/All_Users/College%20Profile
- http://bireporting/PBIRS/Pages/ReportViewer.aspx?/All_Users/Fact_Book_StudentEnrollment

What is Power BI Report Server?

- <https://docs.microsoft.com/en-us/power-bi/report-server/get-started>

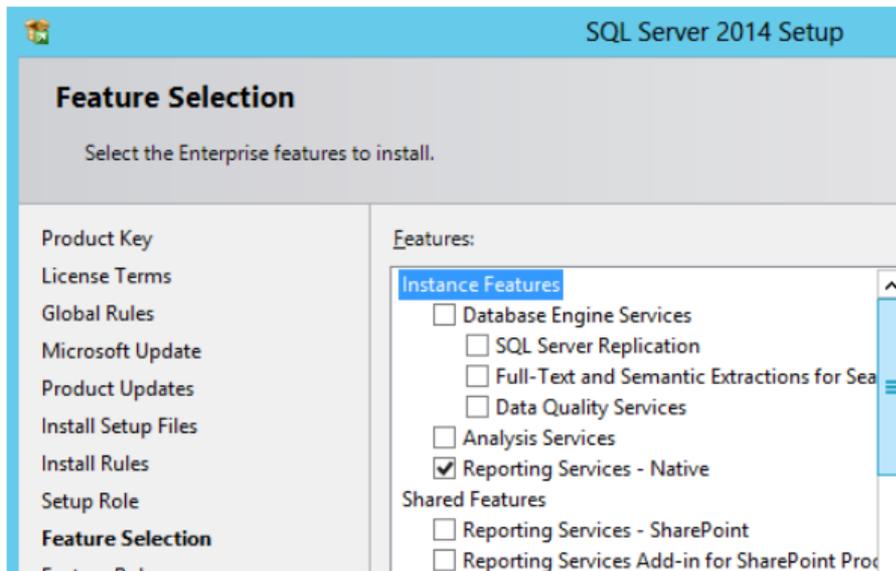

How Do I Install SSRS?

- If you own SQL Server, you own SSRS. SSRS is included in the SQL Server license Standard edition and above:
 - But also including "Express with Advanced Services", however SQL Express in this feature and many is extremely limited.
 - SSRS isn't sold alone, you buy a SQL Server license and you get the database engine, integration services, reporting services, analysis services, agent, etc.
 - The Microsoft Business Intelligence Stack mainly consists of SQL Database Engine, SSRS, SSAS, SSIS and other tools

How Do I Install SSRS?

- SSRS installs from the original SQL Server .iso media you choose Native (standalone) mode or SharePoint integrated mode.
 - Keep in mind that one SQL Server license only allows one SSRS install.

How Do I Install SSRS?

Reporting Life Cycle

- The report from creation to delivery.
- SSRS supports 3 phases of the reporting life cycle:
 - report development.
 - management of the report server.
 - report access by user
- Rendering:
 - reproduce a report in a variety of formats.

Drawbacks:

- Reports are not interactive like power BI and tableau
- You need to use SSRS and Power BI together.

How to create parameters in SSRS?

- To create a parameter in SSRS, click the Create Parameter option on the left hand pane in SSRS
- Enter the Parameter name and the Parameter Prompt. In the below screenshot we are creating a parameter for College.

How to create parameters in SSRS?

- It is recommended to create a dataset to automate the drop down box for each Parameter.
- In the below screenshot we have created a dataset for the College Parameter and are obtaining the values from the dataset.

How to pass parameters to SQL in SSRS?

- Parameters need to be passed sometimes to SQL in SSRS in order to reduce the size of the dataset
- The below is the syntax for passing parameters from Oracle or SQL Server to SSRS.

Syntax:

- WHERE (:College = 'All' or COLLEGE_NAME = :College) (In Oracle SQL)
- WHERE (@College = 'All' or COLLEGE_NAME = @College) (In SQL Server)

Data Regions

- A data region is a layout element that displays data from a single dataset in a Reporting Services paginated report.
- Some of the important data regions in SSRS are:
 1. Table
 2. Matrix
 3. List
 4. Chart
 5. Gauge

Table

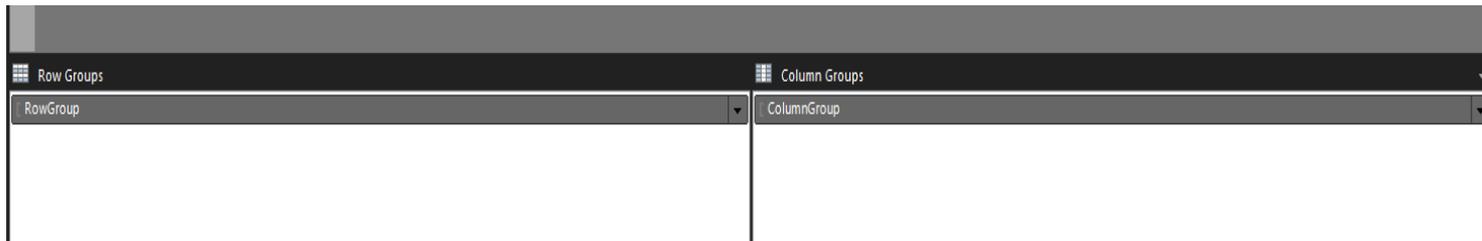

- Use a table to **display detail data, organize the data in row groups, or both.**
- The Table template contains three columns with a table header row and a details row for data.
- The following figures show the initial table template, selected on the design surface.

		Header	
		Data	

Row Groups	Column Groups
(Details2)	

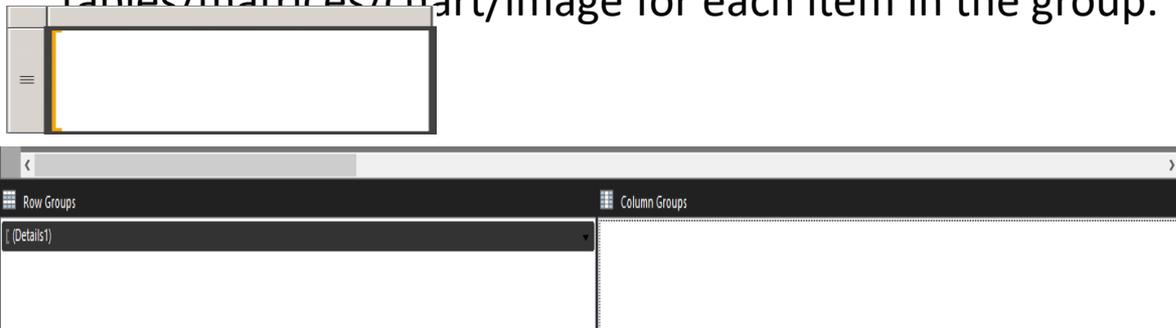

Matrix

- Use a matrix to display **aggregated data summaries, grouped in rows and columns**, similar to a PivotTable or crosstab.
- The number of rows and columns for groups is determined by the number of unique values for each row and column groups.
- The following figures shows the initial matrix template, selected on the design surface:

List

- Use a list to create a free-form layout.
- You are not limited to a grid layout, but can place fields freely inside the list.
- You can use a list to design a form for displaying many dataset fields or as a container to display multiple data regions side by side for grouped data.
- For example, you can define a group for a list; add a table, matrix, chart, and image; and display values in table and graphic form for each group value, as you might for an employee or patient record.
- The List will then iterate through the group in the list and then create multiple tables/matrices/chart/image for each item in the group.

Tips to Know About SSRS

TIP -1

- Never do `SELECT * FROM [table]`
 - Make SQL Server do the work. Filter in your queries with parameters as much as possible. Query on the data (rows AND columns) that you will actually use. Use parameters with default values that are fast-performing, so have start/end dates default to this week, not this year. Have a multiselect drop down default to none or one, not all. (Example: branches)

TIP - 2

– Avoid repeated Columns in the Query

```

1 select
2   STD_TERM_CODE, STD_FRM_PROGRAM, STD_FRM_COLL_CODE, IR_DEPT_COLL.DPCL_PROGRAM_DESC, IR_DEPT_COLL.DPCL_DEPT, IR_DEPT_COLL.DPCL_DEPT
3 from RAVEN.CD_STUDENT
4 left join IR_DEPT_COLL
5 on RAVEN.CD_STUDENT.STD_FRM_PROGRAM= IR_DEPT_COLL.DPCL_PROGRAM_CODE
6 where RAVEN.CD_STUDENT.STD_TERM_CODE>=202010
    
```

Results

Result Sets Messages Explain Plan Pivot & Chart Profiling

TIP – 3

Don't write queries against your live production data, if you can help it.

- Your read-only reports could have a negative performance impact on your read-write queries.
- Lots of other options here: Stage data on another database (even on the same server).

TIP –3

- Don't include extraneous datasets, they will get run even if you don't use them!

TIP - 4

Don't do too much.

- Lots of clients will ask for a single giant report with massive amounts of data.
- They may want some sort of dashboard, but when possible, avoid subreports and break out reports into individual instances.
- Considering building a dashboard as a single new report, independent of subreports

TIP - 5

- Copy report Parameters into the header of the report, so that it is obvious that the data is filtered.
- List out parameter selections, date filters, etc., in the header of the report.

SSRS also has some really cool features behind it, including:

- Scheduling reports to be run and emailed out to users as a PDF or excel spreadsheet .
- Caching the dataset
- Running the report against pre-generated snapshots.

This requires default parameters.
